

Overview

This guide provides step-by-step instructions for manually updating your ControlSpace EX or ESP processor, or PowerMatch, PowerShare, or PowerShareX amplifier with the DesignMax DM12SE loudspeaker preset to ensure optimized performance. These instructions apply when using ControlSpace Designer 5.15.2 or earlier.

The preset is available for download at: boseprofessional.com/en_us/products/software/signal_processing/controlspace_designer.html

Instructions for Manual Update of Loudspeaker Presets

1. Download the loudspeaker preset, unzip the folder, and store it in an accessible location on your computer.
2. Double-click the **SpeakerPEQ** block within the **Signal Processing** view of the processor or amplifier in your system.

If you are using a ControlSpace EX or ESP processor for loudspeaker optimization, you will need to add a SpeakerPEQ from the SP Tool Kit to your design.

3. In the **SpeakerEQ** control panel, click **Load Loudspeaker EQ** and enter the DesignMax DM12SE loudspeaker preset folder you stored in Step 1.
4. Select the **DM12SE.seq** file and click **Open**. Your SpeakerPEQ will update with the correct values.

If you are using a PowerMatch, PowerShare, or PowerShareX amplifier, Bandpass and Limiter settings will also be recalled for the loudspeaker.

Note: You will not be able to use the front panel of PowerMatch amplifiers to recall the DM12SE preset.
